

Nearly half of carriers show signs of poor cyber-security: consultant

By Insurance Marine News, 11th July 2017

Vulnerability to cyber attack is common among the shipping industry, with 44% of carriers displaying low levels of cyber security, according to maritime IT security specialist CyberKeel. SeaIntelligence Consulting CEO and partner Lars Jensen said that “a top-20 carrier allows shippers using their eCommerce platform to use ‘x’ as their password,” while a “top-5 carrier claims that the password ‘12345’ is of ‘medium’ strength”.

“Given the state of affairs in the industry at large, it is crucial that the maritime companies look at the Maersk case and learn from it and create more robust and

resilient systems – otherwise this will not be the last time we see such challenges arise,” Jensen said in a recent [LinkedIn post](#).
